commit ID is c420d21

TD4 questions :

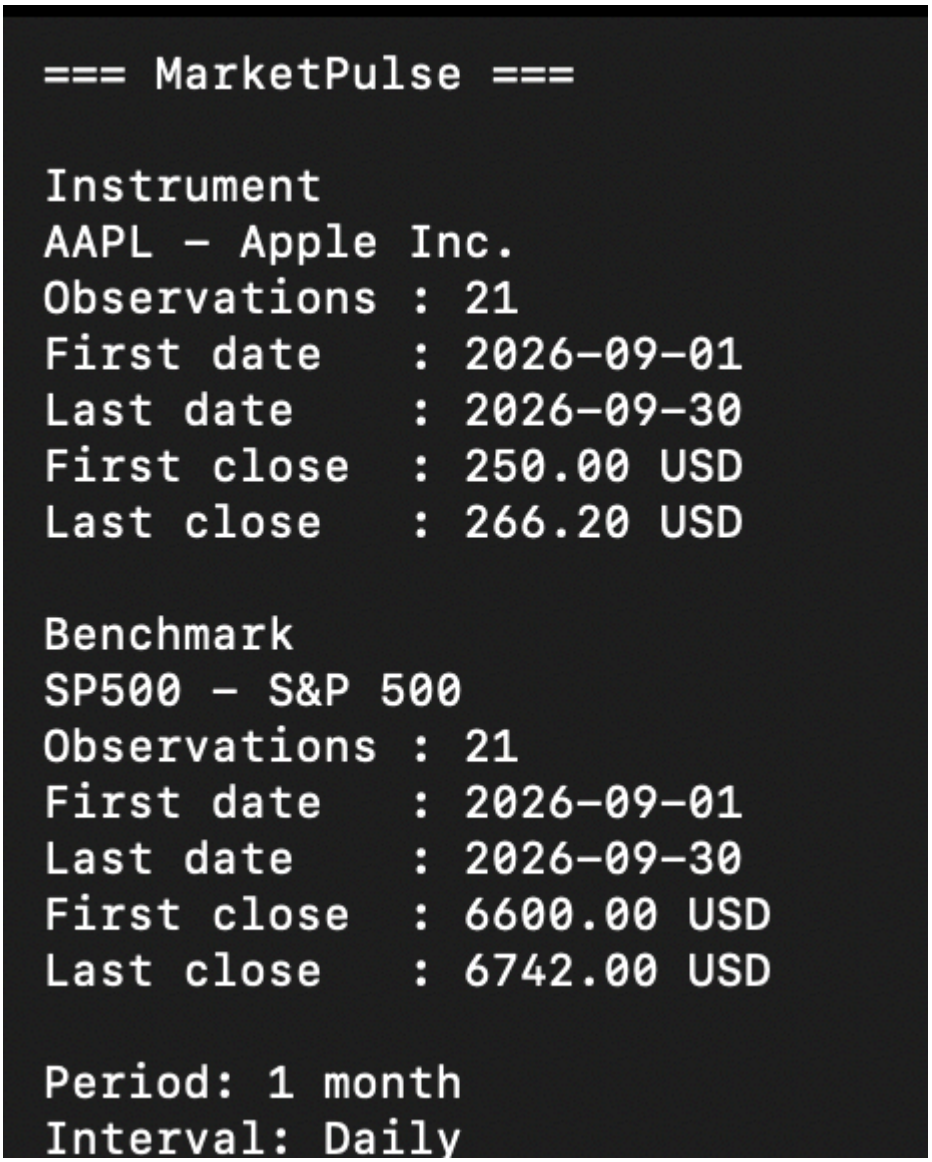

part 6
1. Which change exists on the feature branch?
Commit 44b2d96, which changes only src/main.py (+20 / −13 lines):

Added: get_first_date() and get_last_date(), which read the date of the first and last price row, and display_market_summary(), one reusable function that prints ticker, name, number of observations, first/last date and first/last close.
Removed: the old separate print blocks for the instrument and benchmark (the “Last price” / “Last level” lines and the “Observations” section at the end).
Result: main() now calls display_market_summary() twice, once for AAPL and once for SP500, instead of repeating the print code.

2. Why isn’t that change part of main yet?
Because it was committed while feature/display-observation-dates was checked out. A commit only moves the current branch forward, so main still points to b9cfd52, one commit behind. The feature reaches main only when we merge.

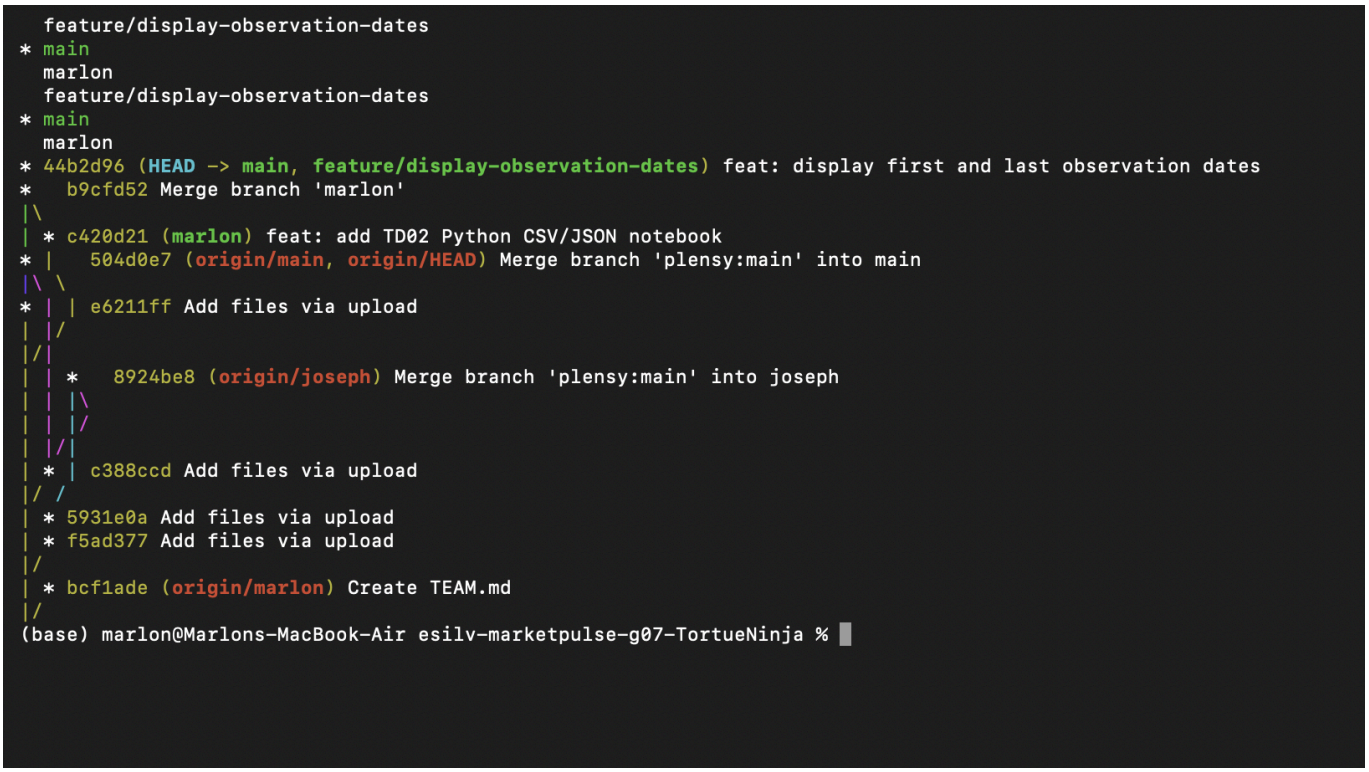

3. What if the branch were abandoned before the merge?
main would stay exactly as it is, without the dates feature, and MarketPulse on main would keep the old output. The work would still exist in commit 44b2d96 on the abandoned branch, but it would never be integrated. That’s the point of branches: unfinished or rejected work can’t break main.

part 7 :
Is the feature now visible from main? Yes. python src/main.py on main shows first/last date and close for AAPL and SP500.
Is the feature commit still visible? Yes. 44b2d96 feat: display first and last observation dates is in the history, and main now points to it.
Fast-forward or merge commit? Fast-forward (“Updating b9cfd52..44b2d96 / Fast-forward”). main hadn’t moved since the branch was created, so Git just slid main forward onto the feature commit. No merge commit was needed.
What does the graph show? HEAD -> main and feature/display-observation-dates both on 44b2d96, directly above b9cfd52. The history is linear at the top: the branch and main are now the same line.
